

HOW TO IMPROVE YOUR “Completeness of Performance” RATING

Submit the following:

1. All Mating Records (Bull in and bull out, AI dates) for specific calving season, as well as the reason for the female not calving.
 2. Complete birth notifications with accurate codes (birth difficulty, calf status etc.) Be sure to submit births for dead calves and abortions as well.
 3. 200 Day (wean) weight along with Dam's weight at wean (Mature Cow Weight).
 4. 400 Day (yearling) weight along with scrotal circumference for bulls.
 5. If possible, have your animals scanned by an Accredited scanner for Carcase EBVs. Contact the office for more information.
 6. 600 Day (final) weight.
- ** Weigh/measure/score always in large groups – rather more animals less frequent than the other way round.
- ** Easiest weighing program is accompanied by a short calving season. If not use the 2 X per year. weighing/measuring program where all the animals on the farm between 4 to 23mths old are weighed. six months apart (*unweaned calves must be pointed out*).
- ** **Mark animals that were treated differently (ill, show, auction) with a Management code of your own choice (max. 2 characters) on the list – this is extremely important.**
- ** Always weigh/point/score before separation occurs (weaning/castrate/culls).
- ** Weigh all animals still on the farms including culls or don't weigh at all. Selective weighing gives you incorrect EBV's.

HOE OM JOU “Completeness of Performance” GRADERING TE VERBETER

Stuur die volgende in:

1. Alle parings inligting (bul-in en bul-uit datums) vir spesifieke kalwing seisoen.
 2. Volledige geboortekennisgewings met akkuraatte kodes (gemak van kalwing, kalf status ens.) Maak seker om geboortekennisgewings vir dooi kalfies en aborsies ook in te stuur.
 3. 200 Dae (speen) gewig tesame met moeder se gewig met speen van kalf (volwasse koei gewig).
 4. 400 Dae (jaaroud) gewig tesame met bulle se skrotum omtrek.
 5. Indien moontlik, kry 'n gakrediteerde skandeerder om u diere te skandeer vir karkas EBVs.
 6. 600 Dae (finale) gewig.
- ** Weeg/Meet/Punt altyd in groot groepe - eerder meer diere minder gereeld as andersom.
- ** Maklikste weegprogram is vergesel met 'n kort kalfseisoen. Indien nie, gebruik die 2x per jaar weeg/meet/program waar alle diere tussen 4 tot 23 maande ses maandeliks geweeg word (kalwers nie gespeen moet duidelik gemerk word).
- ** **Merk alle diere wat anders behandel is (siek, skou, veiling ens..) met 2 letters van u eie keuse – hierdie is BAIE belangrik.**
- ** Weeg / meet / punt altyd voordat diere geskei word met speen / kastreer / uiskot.
- ** Weeg ALLE diere nog op die plaas insluitend uitskot en kommersiële diere OF moet glad nie weeg nie. Selektiewe weeging gee verkeerde EBVs.
